9. ☐ Other \_\_\_\_\_.

### REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance: The closest prior art of record, Oizumi et al. 4,571,279, discloses a method of producing reinforced resin laminates by impregnating a glass cloth with a thermosetting liquid resin free of volatile solvent by curtain flow applicator or dipping bath, covering a copper foil with an adhesive that does not contain solvent, laminating the impregnated glass cloth between the coated copper foil and a release film to form a laminate, guiding the laminate into a curing oven under unpressurized conditions, passing the laminate to the oven for partial curing, then cutting the laminate into predetermined lengths. Eggers et al. 4,659,425 disclose coating a metal foil with solvent-free thermosetting resin, laminating the metal foil with a non-impregnated glass cloth by belts to impregnate the cloth with the resin and partially cure the resin, and cutting the laminate into lengths. Schwarz et al. 4,670,080 discloses edge trimming fully cured metal-laminated base material for printed circuit boards. In the Examiner's opinion, the prior art of record does not disclose or suggest the method of producing a reinforced, partially cured thermosetting polymer film comprising placing an impregnated glass fabric, impregnated by passing over a coating device, on the top surface of thermosetting polymer coated to a precise thickness on a continuous moving web by slot die and melt pumping system and consolidating to form a unitary film, wherein after consolidating to form the unitary film, the unitary film is subjected to steps including metering thickness of the unitary film to the desired thickness using temperature controlled, precision machined and polished metal rollers, and after partially curing, passing the unitary film through a series of chilled rolls to cool the web and placing a fluoropolymer release film on the top surface of the unitary film, as claimed.
